

Bridges

Note: Please note that this section is under active development.

What is a Bridge?

Bridges are a way to connect two different blockchains. They are a special type of smart contract that allows you to lock up tokens on one blockchain and mint the same amount of tokens on another blockchain. This is a very useful feature, as it allows you to transfer tokens between different blockchains. For example, you can transfer tokens from the Ethereum blockchain to the Binance Smart Chain (BSC) blockchain.
