Zero Dev

ZeroDev is a smart, white-labeled, and modular embedded wallet for building user-friendly Web3 experiences, particularly for DeFi applications.

Smart: ZeroDev leverages account abstraction. White-labeled: ZeroDev doesn't have a UI -- it provides the underlying wallet logic that you can build a totally customized experience on top of. Modular: ZeroDev is built on top of Kernel, the most popular open-source smart account that supports ERC-7579 plugins for customizing wallet logic. ZeroDev is one of the most trusted solutions in AA, powering more than 50% of all AA wallets and a majority of DeFi volume that leverages AA.

Before starting please go ahead into [ZeroDev Dashboard](#) and create a project on Open Campus, so you will get a Project ID,

Please find a quickstart [here]

When instantiating the react component please include bundlerProvider="GELATO".

```
<React.StrictMode>
   <ZeroDevProvider
      projectId={YOUR PROJECT ID}
      bundlerProvider="GELATO"
    >
   </ZeroDevProvider>

</React.StrictMode>
```
